

## **JLCooper MCS5 Provides Universal Control for Mac**

MCS5 Media Control Station Provides Tactile Control for Mac Users

Amsterdam, Netherlands (IBC – September 12, 2014) – JLCooper Electronics is showing off their newest development, the MCS5 - Media Control Station. It's the latest in a long lineage of desktop control products, refined for editing audio, video, animation and other applications.

MCS5 is a professional control surface that incorporates transport buttons for record, play, stop, fast forward, rewind and a precision optically encoded jog wheel. MCS5 adds the major improvement of assignable function keys with live button labels. Key Macros and Live Labels are updated instantly, as the user changes tasks or switches applications.

You can easily arrange editing functions into different banks to group frequently used commands. For example, the user can have one bank for ingest, a bank for clip editing, etc. Use and customize supplied keysets for advanced control of applications including Final Cut Pro X, Pro Tools, Media Composer, iMovie, Premiere Pro, Logic Pro, Nuendo, iTunes, GarageBand and others, or make your own.

“MCS5's button labels provide editors with a quick reference to custom keyset control arrangements, allowing users to edit faster with confidence that they are choosing the correct functions” says Chuck Thompson, Vice President and General Manager of JLCooper Electronics.

JLCooper controllers let you work faster. They provide the ease-of-use and tactile assurance that's missing from “software only” user interfaces. Professionals can depend on JLC control products to provide reliable service that far outlasts any alternatives.

JLCooper is devoted to building professional-quality control, interfacing and automation products, used in broadcast television and radio, video production and post-production, audio recording and other markets. They are designed and manufactured in the USA and offered through expert re-sellers world-wide.
